

## Quality Assurance Testing Result

This section summarizes the results of the Quality Assurance (QA) procedures conducted on the Church Management System for Iglesia Filipina Independiente in Morong, Rizal. By applying the developed test cases to the 71 system's core features, the project team verified the technical integrity and stability of the platform's architecture. The findings presented here illustrate the pass/fail rates of the system's parishioner records, sacramental management, and financial modules, serving as the strict benchmark to ensure the system meets the required 95% passing rate for its overall technical success.

| Test Case Number | Test Function                               | Number Of Items | Number Of Items Passed |
|------------------|---------------------------------------------|-----------------|------------------------|
| 1                | User Login & Security                       | 5               | 5                      |
| 2                | Dashboard & User Profile                    | 8               | 7                      |
| 3                | Services Request (Application Process)      | 5               | 5                      |
| 4                | Applications Management (Admin Side)        | 6               | 6                      |
| 5                | Scheduling & Calendar Management            | 5               | 5                      |
| 6                | Services History & Certificate Generation   | 5               | 5                      |
| 7                | Finance: Collections & Donations            | 5               | 5                      |
| 8                | Services Fees Registry & Payment Processing | 5               | 5                      |
| 9                | System Configuration (General Settings)     | 4               | 4                      |

|       |                                                     |    |    |
|-------|-----------------------------------------------------|----|----|
| 10    | System Configuration (Priest Availability & Limits) | 4  | 4  |
| 11    | System Configuration (Services & Requirements)      | 5  | 5  |
| 12    | System Configuration (Payment Methods)              | 4  | 4  |
| 13    | System Configuration (Finance Categories)           | 5  | 5  |
| 14    | System Configuration (Backup & Restore)             | 3  | 3  |
| 15    | System Roles & Permissions                          | 5  | 5  |
| 15    | User Accounts Management                            | 5  | 5  |
| 16    | Comprehensive Reporting & Data Export               | 4  | 4  |
| 17    | System Activity Logs (Audit Trail)                  | 4  | 3  |
| 18    | Administration Turnover                             | 5  | 5  |
| 19    | Activity Logs (Audit Trail)                         | 4  | 3  |
| TOTAL |                                                     | 96 | 93 |

QA Testing Result = (No. of Passed Test Case / No. of Total Test Case) \* 100

QA Testing Result = (93/96) \* 100

QA Testing Result = 0.9687 \* 100

QA Testing Result = 96.88%

The results of the Quality Assurance (QA) testing for the developed Church Management Information System reveal a high level of functional integrity, achieving an overall success rate of **96.88%**. This performance is calculated from the successful execution of **93 out of 96** total test scenarios. Analysis shows that core modules—including User Login & Security, Services Request, Scheduling, and Finance Management—performed with high reliability, while a few specific cases in Dashboard interactivity and Reporting identified minor areas for further optimization.

The implication of these findings is that the system is **"Deployment Ready."** Achieving beyond the industry benchmark of a 95% passing rate indicates a robust and reliable system architecture. Although a small number of test cases required minor

revisions, these do not significantly affect the overall system performance. The results demonstrate that both front-end "gatekeeper" functions and back-end administrative processes operate effectively, ensuring system stability for subsequent User Acceptance Testing (UAT). Supporting this assessment, the ISO/IEC 25010 software quality standard emphasizes that achieving high functional benchmarks is essential in verifying that system features conform to specified requirements prior to official deployment.
